THE ENVIRONMENTAL IMPACT OF A T-SHIRT

Ever wonder where and how our tees are made? We dye and cut everything in the US, putting the environment first.

US
- All of our dyeing and cutting takes place in the USA
- Our dye machines use 2 gallons of water per pound of fabric
- We create steam needed to heat the dye machines through a green energy exchange

THEM
- Most manufacturers produce in China or Central America
- Typical dye machines use 21 gallons of water per pound of fabric
- Steam is created by burning bio-mass like sugar cane, palm oil and other trees

ECO-FRIENDLY VS DIRTY MANUFACTURING
